

Program to check if number is palindrome

- Step1 : Declare a variable and take input from the user for the same.
- Step2 : As our operation involves mathematic operation on original number, thus we need to make copy of it and use to compare for palindrome
- Logic :
- a) variable remainder will store values of last digit, which we can get by % operator
 - b) rnum variable will store values of reversed number.
 - c) After each iteration we can slice last digit away by dividing 10
- Step 3: As now we have reversed number, we can compare and check if it is palindrome
- Step 4 : Print output
